non-slip surface treatment

The most advanced and invisible anti-slip treatment for wet and slippery floors.

R10+ anti-slip treatment is a revolutionary non acid etching anti-slip treatment which will not change the look of your internal or external floor. Suitable for most hard floor surfaces such as ceramic tiles, glazed brick, terrazzo, marble, granite, engineered stone, river rock, concrete, quarry tile and porcelain.

non-slip surface treatment

How does it work?

Moisture Reactive

R10+ anti-slip treatment is chemically bonded into the surface pores of the substrate and reacts when contacted with moisture. The moisture from a wet shoe is enough to create an instant reaction.

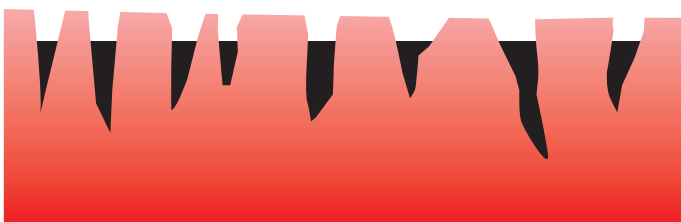

Not a Coating !

R10+ anti-slip treatment is not a coating, once the floor substrate has been treated no cure time or drying time is required therefore the floor can be walked on immediately following application.

Untreated Surfaces

Hard flooring is naturally porous. Water collects, creating a hazardous, slippery surface.

Treated Surfaces

R10+ anti-slip treatment lies below the surface of the flooring when dry, so it is never walked on.

Treated Wet Surfaces

R10+ anti-slip treatment reacts instantly to moisture creating an extremely effective anti-slip condition.
