**EDGEELITE  
SIGNAGE**

**FOR THE**

**21st  
CENTURY**

**Attention grabbers** such as “Notice Boards”, “Specials Boards” & “Instant Menu Boards” can be quickly and easily produced using clear acrylic and Illuminated Marker Pens. We carry a line of Zig pens which are smudge resistant in that they won’t brush off or smear if touched but clean away quickly and completely at the touch of a damp cloth. Ideal as counter signage, because they are clear, they don’t build a wall causing blind spots, between you and your customers.

**Looking for a Back lit style sign** without the bulky box, then the diffuser system is what you need. Ideal for lighting posters, bulletins or photo displays they may also be used to back light opal sheets with translucent graphics. Slim neat and efficient these units can be used with positive or negative graphics.

**Classic design** entrance ways, directional boards, corporate or club emblems take on an added air of distinction when edge lit. Colours are brighter, crisper, cleaner.

**Brightly lit, vibrantly coloured graphics** on clear 10mm or 12mm acrylic can be easily achieved using any of Sasign's edge lit systems. Anything from simple vinyl lettering to unique 3D engraving enhanced by acrylic lacquer in-fills. From illuminated marker pens for instant point of sale signs to long run screen prints, or a combination of these come alive when edge lit.

**Edge lit Signs are extremely versatile.** They may be fixed to a ceiling or overhead beam, suspended on chain or cable, flag mounted or flush mounted to walls. We also have specially designed feet to free stand on a counter, desk or shelf, as well as base units for pedestal style signs.

**The shape** of the acrylic used is governed by the need to allow enough light through the substrate to light the graphics. Contour cut graphics should be edged in white vinyl striping to retain as much light as possible within the blade. Square cornered signs can use white tape or our special black edging provided you use a white double sided tape to secure it in place.

Our **Miniature Extrusion** allows for the use of **Cold Cathode** lighting on a 12V DC power system. As with the **Standard Extrusion**, the lamp and electrical components are on a slide bar, making repairs or replacement quick and easy. Units may be direct mounted to a ceiling or beam using the specially designed **T-piece** or suspended on custom made **Hollow Rod Supports** which also allow the concealment of the figure 8 power leads. Feet are also available for free standing signs.

**End caps**, special pins to hold the acrylic in place, fixing clips for the standard extrusion, VHB self adhesive felt for a buffer between the acrylic & the extrusion, edgings to finish off the edges or hold multiple sheets together, right down to our own acrylic cleaner, polish and anti-static, all available from Sasign International.
