

Shock Track

AVEPRO Shock Track is a professional electrified shock track designed to deter all pest birds from ledges, parapets, beams, roofs and numerous other architectural features. AVEPRO is a strong deterrent to birds and is the least visible product of all bird deterrent systems. The system has been in use for ten years in Australian and New Zealand commercial buildings and industrial applications. AVEPRO Shock offers building managers and professional installers a durable, long Life and low visibility system that can blend in faultlessly with the structure. AVEPRO Shock Track is particularly useful with difficult to manage species such as crows, ravens, cockatoos, Indian mynas and starlings. The system is also well suited to pigeons, sparrows, seagulls and other traditional pest birds.

Available in four colours

High quality materials

Suits most architectural features

AVEPRO Shock product attributes:

- ✓ Available in 4 colours to suit most buildings
- ✓ Low profile - Only 6mm high and Invisible when viewed from below
- ✓ Highly resistant to ultraviolet (U.V.) rays

AVEPRO Shock Track Bird Control Systems

Installation procedure:

AVEPRO Shock Track is attached ledges, pipes, brick, stone walls, steel beams, rooves and building parapets using a special bonding agent. The track is attached to a network of tracks around the structure and connected to an Australian-made energiser which is either solar or 240v powered.

Humane:

While AVEPRO Shock Track delivers a strong message, the high voltage and low amperage shock teaches pest birds to stay away. With our observations over hundreds of installation by our installation network in Australia and New Zealand, we have never seen a bird harmed or injured by the system. AVEPRO Shock Track is in use in zoo's and animal parks in Australia, a symbol that indicates that pest birds are afforded rights to a simple and humane deterrent system.

Strength and durability:

AVEPRO Shock Track offers a 5 year manufacturers product replacement warranty. The product is made from stainless steel and high density, ultra-violet stabilized polyethylene, materials that will last longer than the warranty in place. AVEPRO Shock Track has been in use in Australia since the original launch in 2004.

Low visual impact

At only 6mm high, AVEPRO Shock Track is the least visible of all the physical deterrent systems. When installed and viewed from below, the product is generally not visible. The colours available blend well into most architectural features.

Site access:

When AVEPRO Shock Track is in place, the charge can be quickly turned off at the energiser to avoid an accidental shock when entering an area for maintenance.

Solar charger for up to 100m track

Solar charger for up to 450m track
